### CITY REQUEST FOR BWS POSITION ON 6 LANDFILL SITES

## **BWS RESPONSE DISAPPROVING THE 6 LANDFILL** LOCATIONS OVER THE DRINKING WATER AQUIFER

#### BOARD OF WATER SUPPLY

CITY AND COUNTY OF HONOLULU 630 SOUTH BERETANIA STREET HONOLULU, HI 96843

Roger Babcock, Jr., Ph.D., P.E. Director City and County of Honolulu Department of Environmental Services

#### Dear Dr. Babcock

#### Subject: Response to November 3, 2022 Letter Regarding the Board of Water Supply's Official Position on the Six Potential Landfill Sites

The Honolulu Board of Water Supply (BWS) is in receipt of your November 3, 2022 letter, in which the City and County of Honolulu Department of Environmental Services (ENV) "formally ask[s] for the BWS' official position on the six potential landfill sites" that were evaluated by the Landfill Advisory Committee (LAC)<sup>1</sup> for possible use upon the closure of the Waimanalo Gulch Sanitary Landfill and "clarity on BWS' legal authority over landfill siting."2 For the reasons set forth below, the BWS does not approve any of the six proposed landfill sites that are located above (or mauka) the No Pass Zone and over Oahu's drinking water aguifer system.

#### The Board of Water Supply's Legal Authority Concerning Plans Proposing Waste **Disposal Facilities**

Safeguarding Oahu's water supply from sources of potential contamination is not a matter of discretion; it is constitutionally mandated. The Hawaii Constitution guarantees that "[a]Il public natural resources are held in trust for the benefit of the people" and directs the State, and by extension the BWS, "to protect, control and regulate the use of Hawaii's water resources for the benefit of its people." Haw. Const. art. XI, §§ 1, 7. As the largest municipal drinking water utility in Hawaii, the BWS has a constitutional public trust responsibility to protect the water resources it manages and to preserve the rights of present and future generations in the waters of Hawaii. See Kauai Springs, Inc. v. Planning Comm'n of Cnty. of Kauai, 133 Haw. 141, 171, 324 P.3d 951 (2014) (holding

1 See O'ahu Landfill Siting Study & Landfill Advisory Committee Recommendations: Final Report (June 2022) ("LAC Final Report")

<sup>2</sup> At the October 28, 2022 meeting of the BWS Board of Directors, ENV posed similar questions during an item for information before BWS Board. However, ENV's November 3, 2022 letter is directed to the BWS Manager and Chief Engineer.

December 17, 2024

Roger Babcock, Jr., PhD, P.E. Director Department of Environmental Services City and County of Honolulu roger.babcock@honolulu.gov

#### SENT VIA EMAIL

#### Dear Dr. Babcock

Subject: Mayor's December 10, 2024 Press Conference Announcing the Selection of Area Northwest of Wahiawā as City's Proposed New Landfill Site

The Honolulu Board of Water Supply (BWS) has reviewed the City and County of Honolulu's (City) December 10, 2024 announcement of a potential landfill site located in an area northwest of Wahiawä on agricultural land to the west of Kamehameha Highway, north of Pa'ala'a Uka Püpükea Road (previously referred to as 'Area 3, Site 2' in the Mayor's Landfill Advisory Committee (LAC) June 2022 Final Recommendations Report, and reffered to herein as the 'Proposed Landfill Site'). While BWS appreciates the difficulties associated with selecting a new landfill site, the position of the Office of the Manager and Chief Engineer (OMCE) on the Proposed Landfill Site has not changed. As you know, by letter dated November 15, 2022, I cancinos identified by the Department of Environmental Services (ENV), including the Proposed Landfill Site (Babcock, 2022), because operation of a new landfill at any of these locations may impact the quality and/or quanty of the water resources used or expected to be used as drinking water (Lau, 2022). Neither the City nor ENV scught reconsideration of that final decision.

#### Board of Water Supply's Legal Authority Concerning Plans Proposing Waste Disposal Facilities

BWS is authorized to establish "No Pass Zones," which generally prohibit the installation of waste disposal facilities in sensitive areas in order to protect O'ahu's critical underground drinking water resources from contamination. See BWS Rules and Regulations \$3-301(2). BWS' Rules and Regulations further empower the Manager and Chief Engineer to disapprove proposed waste disposal facilities, including landfills, that may affect the quality and/or quanity of water resources used or expected to be Babcock, Jr. r 17, 2024

domostic water. See BWS Rules and Regulations §3-301(3). All six of the landfill sites in the June 2022 Final Recommendations Report of the LAC are bove the BWS' No Pass Zone and over O'ahu's hydrogeologically-connected water aquifer system. Accordingly, all six proposed landfill sites—including the landfill Site—were disapproved in my November 2022 letter.

s the importance of this groundwater aquifer been more apparent, and never esponsibility to protect it been more paramount. As you know, the people of s still coping with what the Hawa'i State Department of Health aptly described nanitarian and environmental disaster," caused by fuel releases from the ed Hill Bulk Fuel Storage Facility (Red Hill), that resulted in the contamination s drinking water supply and the pollution of this island's irreplaceable soleoundwater aquifer. This unfortunate environmental catastrophe is a stark that we all need to be proactive in protecting all of our precious drinking water s form underground sources of contamination. O'ahu's aquifer cannot be

plained in prior correspondence and presentations to the LAC, BWS wids the need for a new landfill, as well as the challenges associated with new landfill site. We also recognize that modern landfill design and ng can attempt to reduce the risk that contaminant constituents will adversely e environment. However, the Proposed Landfill Site is located above the d No Pass Zone and sits directly over O'ahu's drinking water aquifer system. Geological Survey (USSS), citing EPA studies, has concluded that all landfills will lack into the environment and that the fate and transport of leachate in priment, from both old and modern landfills, are a potentially serious ertal problem (USSS).

data demonstrates that landfill leachates can and do contain a wide range of organic and organic chemical constituents in varying concentrations—such as tals, chichides, volatile and semi-volatile organic, and per- and polylucinated as (PFAS)—that, if released into the environment, have the potential to affect drinking water resources. For example, the Waimānalo Gulch Sanitary anerates approximately 3.6 million gallons of leachate annually that contains concentrations of heavy metals, chiorides, sodium, total dissolved solids enois, and amines well above their respective EPA drinking water maximum ant levels (MCLs). Heavy rainfail can exacerbate landfill leachate containment Indeed, intense storms that occured on O'Ahu in December 2010 and 011 resulted in the generation of additional leachate at the Waimānalo Gulch at utimately gave rise to iliegal discharges of municipal debris, medical waste, ate to the nearby Waimānalo Gulch stream and ultimately the Pacific Ocean. chate from the Propsed Landfill Ste would constitude a significant scurce of nontamination that could impact O'ahus groundwater aquifer system.

hu's groundwater is hydrogeologically-connected and groundwater is always ontamination in one part of the aquifer can spread to and impact other parts of r. Further, groundwater flow can be unpredictable and can move relatively Dr. Roger Babcock, Jr. December 17, 2024 Page 3

quickly (greater than ten feet per day in some instances). Because of this, contaminant migration along preferential flow paths will likely elude even a robust monitoring well network and undelected contaminants could make their way to drinking water production wells before any corrective action can occur. As a result, contamination from landfill leachate poses a considerable risk to both O'ahu's groundwater aquifer and drinking water resources. If such contamination were to occur, it could—as was the case for Red Hill—eventually cause BWS to sult down its water supply wells in the vicinity of the source of contamination at the landfill.

In sum, the No Pass Zone was established to protect O'ahu's drinking water from underground sources of contamination and there is a compelling basis upon which to expect that a landfill situation at the Proposed Landfill Site may impact the quality and/or quantity of the water resources used or expected to be used as drinking water. Accordingly, for the reasons provided in my November 16, 2022 letter (Lau, 2022) and reiterated above, I reaffirm my prior disapproval of the Proposed Landfill Site.

BWS is committed to safeguarding Hawai'i's critical drinking water resources for present and future generations and continues to urge ENV to explore new landfill sites that are below the No Pass Zone. If you have any questions, please feel free to contact me at (808) 748-5061.

Very truly yours,

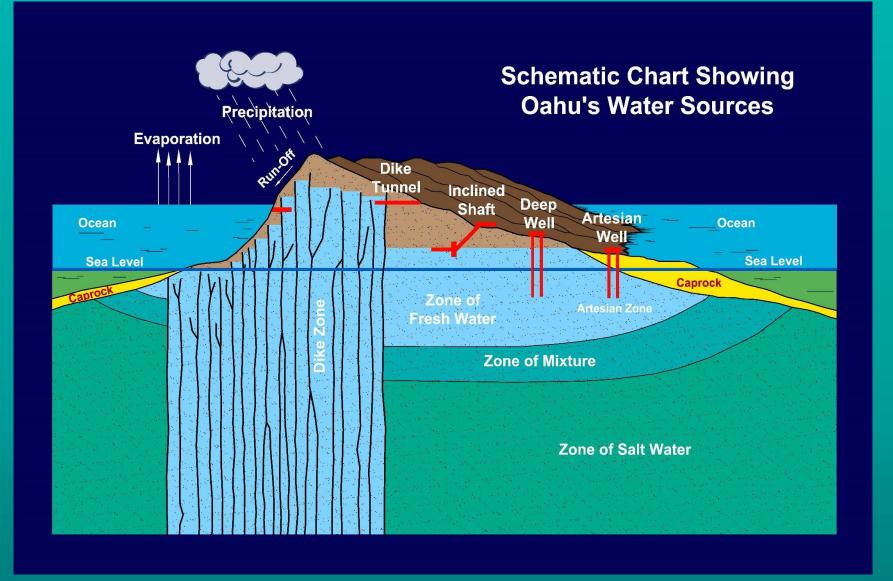

Ernest Y.W. Lau, P.E. Manager and Chief Engineer

## **KEY POINTS OF CONCERN**

- •Oahu is 100% dependent on its groundwater aquifer for drinking water.
- •Landfills contain contaminants that can enter groundwater.
- •Landfills, once constructed will be there permanently.
- Preservation and protection of our precious and pure groundwater resources are essential to ensure water security for our future for generations to come.

### LANDFILLS

- EPA has concluded that all landfills eventually leak into the environment (Fed. Reg. v. 53, no. 168, August 30, 1988)
- Christenson and Cozzarelli, US Geological Survey, August 2003
  - Although liners and leachate collection systems minimize leakage, liners can fail and leachate collections systems may not collect all the leachate that escapes from a landfill.
  - The fate and transport of leachate in the environment, from both old and new landfills, is a potentially serious environmental problem.
- Landfill liners and cover systems are designed to contain leachate and control emissions, but even the best-designed systems will fail at some point unless they are replaced or the waste is removed (EPA's 2020 Interim Guidance, December 18, 2020).
- Waimanalo Gulch Landfill generates about 3.6 MG leachate annually (9,800 GPD) \* Landfills in higher rainfall areas can yield higher leachate volumes.

## BWS NO-PASS ZONE

November 28, 2020 www.boardofwatersupply.com

### OAHU'S GROUNDWATER BODIES AND CAPROCK

- Oahu is 598 square miles
- About 461 square miles of Oahu (77% of the island) are inland of the caprock
- About 137 square miles (23% of the island) are covered by caprock

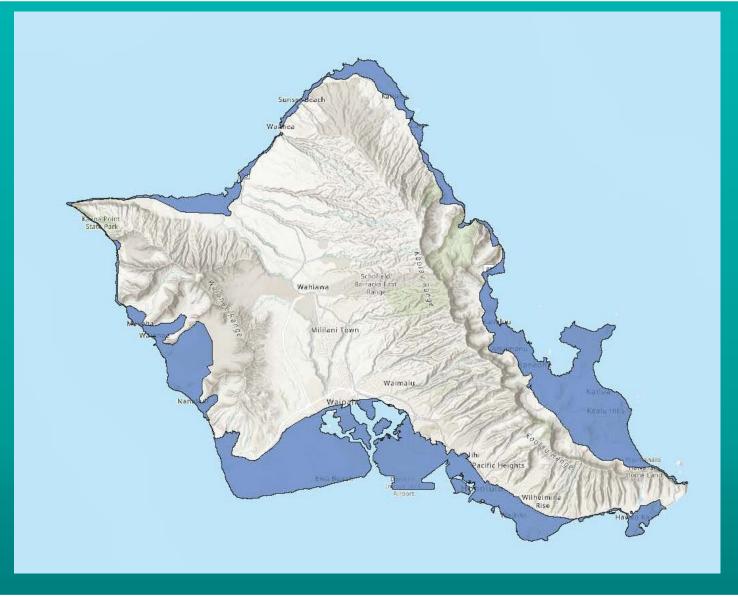

Ref. Izuka, Engott, Rotzoll, Bassiouni, Johnson, Miller and Mair, Volcanic aquifers of Hawai'i—Hydrogeology, water budgets, and conceptual models, Scientific Investigations Report 2015-5164, United States Geological Survey, 2015

#### BWS "No Pass Zone"

Established December 9, 1982 (Resolution 502, 1982).

Amended BWS Rules and Regulations Section 3- 301 to add definition and establishment of "No Pass Zone" and outlining an appeals procedure from decisions of the Manager relative to the "No Pass Zone"

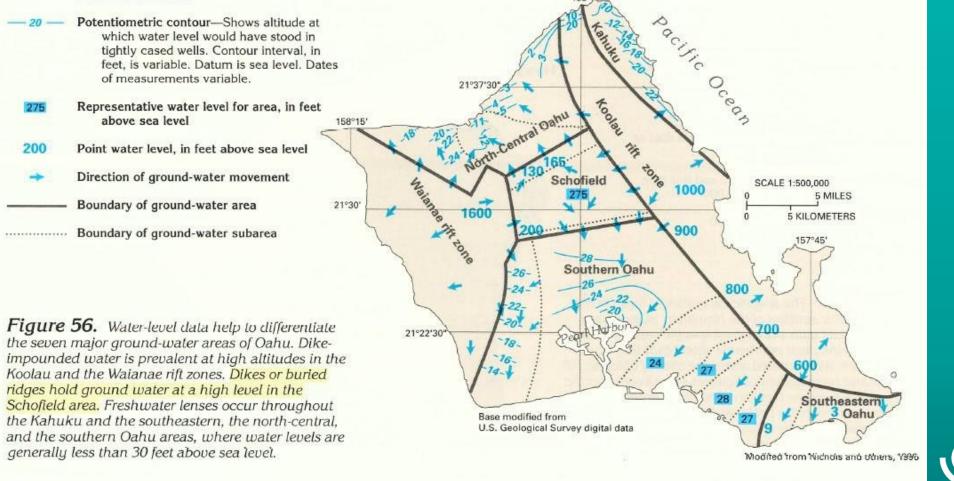

Blue = Pass Zone White = No Pass Zone

#### **EXPLANATION**

Ground Water Atlas of the United States, Segment 13, USGS, revised 1999

### **BWS PASS, NO-PASS ZONE GUIDELINES**

- The Pass/No-Pass Zone delineation maps are used as guidelines for Groundwater Protection in implementing Section 3-301 Waste Disposal Facilities, BWS Rules and Regulations.
- The Pass zone represents areas overlain by thick "caprock" (unconsolidated and consolidated sediments, corals and weathered volcanic rock) above the permeable volcanic rock aquifers.
- The No Pass zone represents areas over the freshwater aquifer with a smaller or nonexistent caprock.
- The Pass/No-Pass zone delineation is based upon hydrogeologic literature research and data analysis by the BWS Hydrology-Geology Branch. Requests for reconsideration of No-Pass line locations should be based on technical data including boring logs which indicate that the proposed waste disposal facility in the "No Pass Zone" would not contaminate groundwater resources used or expected to be used for domestic water supplies.

#### CHAPTER III: PROTECTION, DEVELOPMENT AND CONSERVATION OF WATER RESOURCES SEC. 3-301: WASTE DISPOSAL FACILITIES

- 1. All plans proposing the following waste disposal facilities must have the written approval of the Manager:<sup>1</sup>
  - 1. Sewage disposal systems.
    - 1. (1) Cesspools.
    - 2. (2) Septic tank systems.
    - 3. (3) Individual household aerobic treatment units.
  - 2. Disposal wells.
  - 3. Sanitary landfills.
  - 4. Refuse disposal dumps.
  - 5. Sewage treatment plants.
  - 6. Stabilization ponds.
  - 7. Any other wastewater disposal facilities.
- 2. The Department may establish "No Pass Zones" which shall be delineated on "No Pass Zone" maps. These maps shall be used as guidelines in implementing this Section.

Footnote: <sup>1</sup> Per March 6, 1989 BWS-DOH Agreement to Regulate the Ground Disposal of Wastes on Oahu. DOH will APPROVE/DISAPPROVE waste disposal facilities with consideration of BWS's advice. The Agreement was in response to the DOH adoption of Ch. 11-62, and Ch. 11-23, HAR.

- 3. The Manager may at his discretion, withhold his approval, if there is any basis to expect that the operation of the proposed waste disposal facility and any wastewater therefrom may to any degree affect the quality and/or quantity of water resources used or expected to be used for domestic water.
- 4. If the Manager disapproves a proposal, he shall inform the applicant in writing of the facts and reasons upon which his disapproval is based and afford the applicant an opportunity for an informal appeal hearing. Any applicant who is aggrieved by the Manager's decision and desires reconsideration of such decision shall petition the Manager in writing within 30 days from the date of receiving such decision. The applicant should base his request for reconsideration on pertinent technical data, including boring logs which indicate that the proposed waste disposal facility in the "No Pass Zone" would not contaminate groundwater resources used or expected to be used for domestic water supplies. If after the hearing, the request for reconsideration is disapproved by the Manager, the applicant may appeal the decision to the Board, which shall have the power to affirm, modify or reverse the decision of the Manager so appealed from. Such appeal shall be taken within 30 days after the final decision of the Manager.

## **KEY POINTS OF CONCERN**

- •Oahu is 100% dependent on its groundwater aquifer for drinking water.
- •Landfills contain contaminants that can enter groundwater.
- •Landfills, once constructed will be there permanently.
- Preservation and protection of our precious and pure groundwater resources are essential to ensure water security for our future for generations to come.

Source Water Protection Plan's Guiding Principle

**Prevention** of sources from degradation is always preferable to mitigation and clean-up, thus **reducing risk** is the **foundation** of our Source Water Protection Plan
